# The Rockhoppers

The team stayed true to the Project Tasks from the March 6 Deliverables. Jacob worked to build the login and signup module for applicants and faculty. He defined the user roles (GS, CAC, Applicant, etc.), and ensured that the interface displays the appropriate items for users to interact with (these items are different for each role). The student administrator can sign up new faculty members and the GS can update the database with the final decision. Arjun developed the front end of the website for applicants to enter personal and academic information about their application. He handled receiving letters of recommendations, and set up bootstrap for the user interface. Alex developed the faculty review process so that faculty can view applicants who have completed their application and review those applicants. The CAC can rate the letter of recommendation and can update the final decision.

One assumption made is that the transcript must be submitted last. Another assumption is that the personal and academic information forms will only be filled out once per user. A given faculty member can only evaluate a specific student once. A recommender will copy paste the uid without error, and not use conjunctions. One other important thing to point out is that in the database starting state defined by the phase 1 submission requirements, it says to leave the names with associated ids: 11111111,22222222,33333333,44444444. Just as we did not get to pick our unique GWID, a university applicant would never be able to choose their own id. Our database auto increments, so there is no way that someone testing our project could come in and create Stan Getz with id 44444444. For the same reason, John and Ringo get id's 11111111 and 11111112 because they are the first two applicants in our system.
